

Geospatial analysis supports optimization activities throughout all stages of an environmental site by:

- improving performance of characterization and remediation activities;
- increasing monitoring efficiency; and
- justifying decisions at environmental sites.

This guidance illustrates the practical application of geospatial analyses to support optimization activities, and serves as a companion to [Groundwater Statistics for Monitoring and Compliance: Statistical Tools for the Project Life Cycle \(GSMC-1\)](#). If you are visiting this site for the first time, please review the [Overview](#) of this guidance. All users may find the [Navigating this Website](#) page helpful.
